

Learning C# , ASP.NET :

I am proficient in Java. My supervisor wants me to involve in a project where we need C# and its framework to write codes. With a Java background, it will not be very difficult to learn C# and its framework. I have learnt some basic framework from the YouTube tutorial. I am planning to buy an Udemy Course by C# professional to get an in-depth idea about the language and framework. As, I have already started working with the project, it will be easy for me to track my progress through the progress of the project. I have given myself a 1 month of timeframe to learn the ASP.NET framework before I jump in more into deep infrastructure of the projects.

Learning JavaScript:

I am learning JavaScript too. Because all the projects that my supervisor talked about were web app. And to make the web app dynamic with HTML and CSS, there is no easy alternative without the JavaScript. I have some prior knowledge about JavaScript but I want to master it, so that I can fix any issues within my project without taking any help from the internet. As I am the only one who is responsible for the project, the progress will be monitored through the progress of the projects done. I have given myself a time frame of 4 months before mastering the JavaScript.

Time Management:

I just realized while writing this, that I have a very bad habit of missing deadlines when multiple tasks start to show up. I must increase my time sense by this work term. I have missed some assignments for being less careful about the time. I have been determined to submit everything before the deadline. I will track my goal by the work term assignments submission in Moodle. I am planning to be punctual before this work term course finishes. I will start to write down my to-do list and put this in front of my working screen so that I never forget the next coming deadline.
